NAME

ttftotype42 – create PostScript Type 42 wrapper of TrueType font

SYNOPSIS

ttftotype42 [*input* [*output*]]

DESCRIPTION

Ttftotype42 converts TrueType or TrueType-flavored OpenType font programs into PostScript Type 42 format, which is a wrapper for the TrueType outlines. This conversion preserves all outlines and hint information from the original TrueType font. The Type 42 wrapper uses glyph names identical to those expected by **pdflatex**(1) or **otftotfm**(1), so encoding files suitable for TrueType fonts and **pdflatex** will also work for the Type 42 fonts and **dvips**(1). If the file *output* is not specified output goes to the standard output. If the file *input* is not specified input comes from the standard input.

OPTIONS

−**o** *file*, −−**output** *file*

Write output font to *file* instead of the standard output.

−**q**, −−**quiet**

Do not generate any error messages.

−**h**, −−**help**

Print usage information and exit.

−**v**, −−**version**

Print the version number and some short non-warranty information and exit.
