NAME

allec – force the most important ec–fonts to be calculated

SYNOPSIS

allec [−r]

DESCRIPTION

allec forces a large number of ec-style Fonts to be calculated as pixel files. This is done through running *dvips*(1) over a certain test-file. Therefore, the fonts are created in the resolution needed by dvips.

If the −r flag is specified, the command *dvired*(1) will be used instead of dvips.

alldc does not recalculate existing fonts (as long as the Metafont mode does not change).

SEE ALSO

allcm(1), allneeded(1), dvips(1), dvired(1).
